the 1990s, the number of people in the UK who are aged 65 and over has increased from 10.5 million to 13.5 million (13.5% of the population).

There is a growing awareness of the need to address the health care needs of the elderly population. The Department of Health (1998) has set out a strategy for the care of the elderly, and the Health Service Research Department (1998) has published a report on the health care needs of the elderly population in the UK.

The Health Service Research Department (1998) report states that the health care needs of the elderly population are complex and multifaceted. It is important to understand the health care needs of the elderly population in order to develop effective health care services for them.

The Health Service Research Department (1998) report identifies a number of key areas of concern for the health care needs of the elderly population. These include: physical health, mental health, social health, and health care access.

Physical health: The Health Service Research Department (1998) report states that the elderly population has a higher prevalence of chronic diseases and conditions than the younger population. These include: heart disease, stroke, cancer, and arthritis.

Mental health: The Health Service Research Department (1998) report states that the elderly population has a higher prevalence of mental health problems than the younger population. These include: depression, anxiety, and dementia.

Social health: The Health Service Research Department (1998) report states that the elderly population has a higher prevalence of social isolation and loneliness than the younger population. This is due to a number of factors, including: loss of family and friends, and loss of independence.

Health care access: The Health Service Research Department (1998) report states that the elderly population has a higher prevalence of barriers to health care access than the younger population. These include: lack of transport, lack of information, and lack of financial resources.

The Health Service Research Department (1998) report identifies a number of key strategies for addressing the health care needs of the elderly population. These include: promoting independence, providing social support, and ensuring access to health care services.

The Health Service Research Department (1998) report also identifies a number of key areas for further research. These include: the health care needs of the elderly population in different settings, the health care needs of the elderly population in different countries, and the health care needs of the elderly population in different cultures.

The Health Service Research Department (1998) report is a valuable resource for health care professionals and researchers. It provides a comprehensive overview of the health care needs of the elderly population in the UK, and identifies key areas for further research.

The Health Service Research Department (1998) report is available in full on the Health Service Research Department website (<http://www.hsrp.ac.uk/>).

The Health Service Research Department (1998) report is a key document in the development of health care services for the elderly population in the UK. It provides a comprehensive overview of the health care needs of the elderly population, and identifies key areas for further research.
